

CYBATHLON Presentation at MESROB 2020

The CYBATHLON focuses on the development of user-driven design and the implementation of assistive technology for people with disabilities.

What began as an idea to promote the development of everyday-suitable assistance systems and inclusion of people with disabilities through a competition, has grown to be a powerful communication and exchange platform, which interactively showcases the interplay between humans and technology and its potential to remove barriers.

At MESROB 2020, you will have the opportunity to learn about state-of-the-art assistive technology before the second edition of the main CYBATHLON event (19./20. September 2020). CYBATHLON teams will reveal how the future of assistive technology could look like and present their latest developments to provide day-to-day-support for people with disabilities

During the live demos, the teams showcase the devices they just used to compete in the CYBATHLON races, and give an idea, what robotics and neuro-technology are capable of today and where they still have their limitations.
